

IDENTIFIES BOTH RESIDENT & VEHICLE FOR HIGHER SECURITY & FASTER THROUGHPUT

☐ Entry Point Choices

Vehicle I.D. Tag or Key Ring Transmitter

☐ Instant Recognition

Resident & Vehicle Type Are Displayed In 70 Milliseconds

☐ Granting Access

Automatic Instant Access Granted by The Computer
Guard Grants Access After Viewing Transaction Display

FAST, POSITIVE IDENTIFICATION

No human can compete with a computer when it comes to information processing. When the objective is fast accurate access control decision making, the Toye Corporation "PC" Central system grants access in less than one second, freeing up guard time for visitors and exceptions. At times when human intervention is desired, the system will let the guard open the gate after verifying that the vehicle and occupant match the profile displayed on the computer.

A two class system allows for automatic authorization for some vehicles, and guard intervention for others, the customer can decide how best to utilize these powerful features.

FEATURES

- Enhances security by combining vehicle and occupant identification.
- Reduces guard intervention and processing time dramatically.
- Anti-Tailgating prevents multiple entries within the same minute.
- Restricts regular guests to specific days and times.
- Instant voiding of lost or stolen TAGS.
- Audit trail logs every transaction and its disposition. When combined with video surveillance, incidents may be resurrected precisely as they occurred.
