

Access Anywhere-IP Software

Access Anywhere-IP is a revolutionary new software program that allows programming of up to eight Toye network controllers over the Internet and on your local area network. Simply enter the static IP address of each network controller, and the software will find it and send and receive updates.

Access Anywhere-IP Features:

- Program up to eight (8) Toye network controllers automatically.
- Remote network controllers can be connected to the Internet with DSL lines.
- Local network controllers can be accessed over the customer's LAN or WAN.
- Just fill in the IP address, user name and password, and click the PC icon. All network controllers will be programmed automatically.
- Any communication failures will be noted with a large X, so you know there is a problem at that location with the IP connection.
- Select any of the eight (8) locations. Send to one, two or any combination of locations.
- Upload transaction history from each network controller for extensive history reports.
