

A Floating Desktop Counter Display

Building and Parking Occupancy Counts

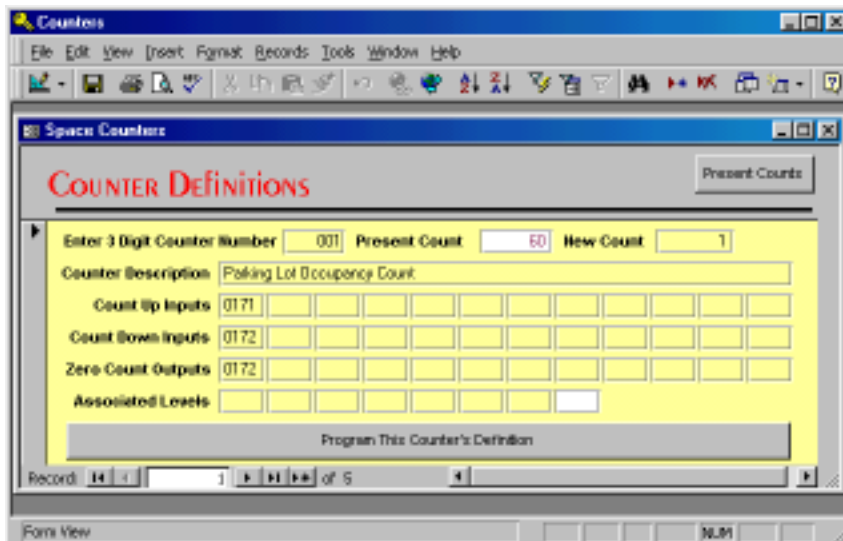

An Accurate Real Time Count Display

This is an independent software module just for counters. It can be placed on your desktop, or on a remote PC connected to a network. It always displays the current counts as they occur a real time. You can define any number of counters for up counts, down counts, and differential counts. You can display the values of all counters at once as shown, or just one counter.

Reserved Spaces

With the Tenant Specific Space Allocation option, you can associate a counter value to a level so that when the value of that counter is zero, all other cards in that level are denied access until a vehicle exits. You do not need an actual input to increment or decrement this counter. The card transaction does it in software.

Statistical Counting

Each up count, and each down count may be used in the definitions of as many separate counters as needed. This allows you to create real time statistics. An entrance loop input might be used in counters for: Total Entries, Current Occupancy, and Spaces Available.
